

Don't blow up your computer!

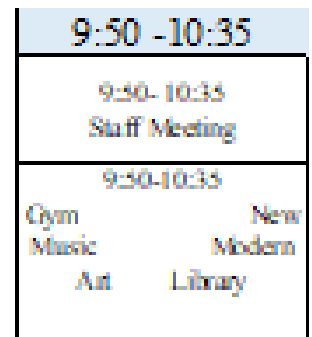

I worked with someone today and learned how to use Alt+Enter in Excel to make a cell behave the way we wanted it to.

Here is the scenario...Using wrap text to keep the cell a specific size the spacing was created using the space bar. Here is the cell and how the spaces showed up in the formula bar.

Sorry about the blurry images...snipping tool is only as good as the original.

Unfortunately, when it went to print this is how it looked in print preview and would print that way...

The correct way to make the list is after typing the word Gym I selected Alt+Enter and now the list was created and this is how it would print...

If we are lucky we can learn something new every day.
